

Briggs & Stratton 206 side cover gasket
Visual Update – 4/28/2017
(Non-impacting)

Beginning in late May all 206 engines and short blocks will be manufactured using a form in place side cover gasket.

“The 206 sealed design allows us to implement an automotive style approach to sealing which is not practical on our other race engines due to the nature of how they are used”, stated David Klaus, Director – Briggs & Stratton Racing. A form in place gasket creates a 100% surface contact providing uniform stress distribution and improved vibration dampening. “While the quality and durability of our products are known continual improvement is what our customers have come to expect when they see the diamond and bar logo. It’s part of our DNA.”
